

Exp. No. 1

Develop a lexical Analyzer to identify identifiers, constants, operators using C program.

Program:

```
#include<stdio.h>
#include<ctype.h>
#include<string.h>
int main()
{
    int i,ic=0,m,cc=0,oc=0,j;
    char b[30],operators[30],identifiers[30],constants[30];
    printf("enter the string : ");
    scanf("%[^\\n]s",&b);
    for(i=0;i<strlen(b);i++)
    {
        if(isspace(b[i]))
        {
            continue;
        }
        else if(isalpha(b[i]))
        {
            identifiers[ic] =b[i];
            ic++;
        }
        else if(isdigit(b[i]))
        {
            m=(b[i]-'0');
            i=i+1;
            while(isdigit(b[i]))
            {
                m=m*10 + (b[i]-'0');
                i++;
            }
            i=i-1;
            constants[cc]=m;
            cc++;
        }
    }
}
```

```

else
    {
    if(b[i]=='*')
        {
            operators[oc]='*';
            oc++;
        }
    else if(b[i]=='-')
        {
            operators[oc]='-';
            oc++;
        }
    else if(b[i]=='+')
        {
            operators[oc]='+';
            oc++;
        }
    else if(b[i]=='=')
        {
            operators[oc]='=';
            oc++;
        }
    }

}

printf(" identifiers : ");
for(j=0;j<ic;j++)
{
    printf("%c ",identifiers[j]);
}
printf("\n constants : ");
for(j=0;j<cc;j++)
{
    printf("%d ",constants[j]);
}
printf("\n operators : ");
for(j=0;j<oc;j++)
{

```

```

        printf("%c ",operators[j]);
    }
}

```

Output:

enter the string : a = b + c * e + 100
 identifiers : a b c e
 constants : 100
 operators : = + * +

Exp. No. 2

Develop a lexical Analyzer to identify whether a given line is a comment or not using C

Program:

```

#include<stdio.h>
#include<conio.h>
int main()
{
    char com[30];
    int i=2,a=0;
    printf("\n Enter comment:");
    gets(com);
    if(com[0]=='/')
    {
        if(com[1]=='/')
            printf("\n It is a comment");
        else if(com[1]=='*')
        {
            for(i=2;i<=30;i++)
            {
                if(com[i]=='*'&&com[i+1]=='/')
                {
                    printf("\n It is a comment");
                    a=1;
                    break;
                }
            }
            else

```

```

                                continue;
                            }
                        if(a==0)
                            printf("\n It is not a comment");
                    }
                else
                    printf("\n It is not a comment");
            }
        else
            printf("\n It is not a comment");
    }
}

```

Output:

Input: Enter comment: //hello

Output: It is a comment

Input: Enter comment: hello

Output: It is not a comment

Exp. No. 3

Design a lexical Analyzer for given language should ignore the redundant spaces, tabs and new lines and ignore comments using C

Program:

```

#include<stdio.h>
#include<stdlib.h>
#include<string.h>
#include<ctype.h>

int isKeyword(char buffer[]){
    char keywords[32][10] =
    {"main","auto","break","case","char","const","continue","default",
    "do","double","else","enum","extern","float","for","goto",
    "if","int","long","register","return","short","signed",
    "sizeof","static","struct","switch","typedef",
    "unsigned","void","printf","while"};
    int i, flag = 0;

```

```

for(i = 0; i < 32; ++i)
{
if(strcmp(keywords[i], buffer) == 0)
{
flag = 1;
break;
}
}
return flag;
}

```

```

int main()
{
char ch, buffer[15], operators[] = "+-*/%=";

        printf("Modulus");
        break;
    default:
        printf("\n Not a operator");
    }
}

```

Output:

Enter any operator:<=
Less than or equal

Exp. No. 5

Design a lexical Analyzer to find the number of whitespaces and newline characters using C.

Program:

```

#include <stdio.h>
int main()

```

```

{
    char str[100]; //input string with size 100

    int words=0,newline=0,characters=0; // counter variables

    scanf("%[^~]",&str); //scanf formatting

    for(int i=0;str[i]!='\0';i++)
    {
        if(str[i] == ' ')
        {
            words++;
        }
        else if(str[i] == '\n')
        {
            newline++;
            words++; //since with every next line new words start. corner case 1
        }
        else if(str[i] != ' ' && str[i] != '\n'){
            characters++;
        }
    }
    if(characters > 0) //Corner case 2,3.
    {
        words++;
        newline++;
    }
    printf("Total number of words : %d\n",words);
    printf("Total number of lines : %d\n",newline);
    printf("Total number of characters : %d\n",characters);
    return 0;
}

```

Output:

```

void main()
{
    int a;

```

```
int b;  
a = b + c;  
c = d * e;  
}  
Total number of words : 18  
Total number of lines : 7
```

Exp. No. 6

Develop a lexical Analyzer to test whether a given identifier is valid or not using C.

Program:

```
#include<stdio.h>  
#include<conio.h>  
#include<ctype.h>  
int main()  
{  
    char a[10];  
    int flag, i=1;  
    printf("\n Enter an identifier:");  
    gets(a);  
    if(isalpha(a[0]))  
        flag=1;  
    else  
        printf("\n Not a valid identifier");  
        while(a[i]!='\0')  
        {  
            if(!isdigit(a[i])&&!isalpha(a[i]))  
            {  
                flag=0;  
                break;  
            } i++;  
        }  
    if(flag==1)  
        printf("\n Valid identifier");  
}
```

Output:

Enter an identifier:abc123

Valid identifier

Exp. No. 7

Write a C program to find FIRST() - predictive parser for the given grammar

$S \rightarrow AaAb / BbBa$

Exp. No. 10

Implement a C program to eliminate left factoring from a given CFG.

$S \rightarrow iEtS / iEtSeS / a$

$E \rightarrow b$

Program:

```
#include<stdio.h>
#include<string.h>
int main()
{
    char
gram[20],part1[20],part2[20],modifiedGram[20],newGram[20],tempGram[20];
    int i,j=0,k=0,l=0,pos;
    printf("Enter Production : S->");
    gets(gram);
    for(i=0;gram[i]!='\0';i++,j++)
        part1[j]=gram[i];
    part1[j]='\0';
    for(j=++i,i=0;gram[j]!='\0';j++,i++)
        part2[i]=gram[j];
    part2[i]='\0';
    for(i=0;i<strlen(part1) || i<strlen(part2);i++)
    {
        if(part1[i]==part2[i])
        {
            modifiedGram[k]=part1[i];
            k++;
            pos=i+1;
        }
    }
    for(i=pos,j=0;part1[i]!='\0';i++,j++){
        newGram[j]=part1[i];
    }
```

```

newGram[j++]='|';
for(i=pos;part2[i]!='\0';i++,j++){
    newGram[j]=part2[i];
}
modifiedGram[k]='X';
modifiedGram[++k]='\0';
newGram[j]='\0';
printf("\n S->%s",modifiedGram);
printf("\n X->%s\n",newGram);
}

```

Output:

Enter Production : S->iEtS|iEtSeS|a

S->iEtSX

X->|eS|a
